

Top reasons to buy Brown EF/A Scales

Clinical and research-based anchoring: ADHD symptoms are measured directly and quantifiably; test results can be used to suggest possible diagnoses as well as testable hypotheses about a patient's executive functions.

Items are more specific and contextual: Patients with ADHD experience much situational variability with ability to focus on *specific activities which hold strong interest for them*, but more limited ability to focus on less interesting tasks, even when they may be important. The Brown EF/A Scales™ include items that ask about difficulties encountered in *specific contexts*, e.g. difficulty remembering what has been read (when reading is assigned, vs. self-selected texts).

Multiple-perspective assessment: The Brown EF/A Scales provide a comprehensive evaluation of an individual's ADHD symptoms by using multiple perspectives: self-perspective, teacher's perspective and parents' perspective.

Focuses on severity as opposed to frequency: Unique to the Brown EF/A Scales, items focus on severity of specific problems rather than frequency. This allows examinees to report more accurately *how much difficulty* they experience with each specific symptom.

Includes DSM®-5 symptoms of ADHD and more: The Brown EF/A Scales assess other important aspects of executive function impairments found in persons with ADHD, but not yet included in DSM-5 diagnostic criteria for ADD/ADHD.

Assess the executive functions of other diagnostic groups: Difficulties with EF are often found in students with emotional and behavioral disorders (EBDs); neurodevelopmental disorders; autism spectrum disorders (ASD); and specific learning disabilities (SLD); or as a result of injury or trauma.

Reports guide interventions: Cluster scores in the reports developed around the 6 Executive Functions from Dr. Brown's model provides a starting place for the development or selection of interventions to support treatment and/or instructions.

Progress monitoring: Developed to be able to differentiate between administrations for the purpose of determining the effectiveness of treatments (including medication).
